# Installing MSCOMCT2.OCX and/or FM20.DLL

MSCOMCT2.OCX is a 32 bit object library for Windows, and being a 32 bit library it is not included with 64 bit versions of Windows and is not compatible with 64 bit versions of Office. It may however be installed in 64 bit versions of Windows for use with 32 bit versions of Office, to enable a number of the add-ins from my web site www.gmayor.com to be used on recent PC hardware.
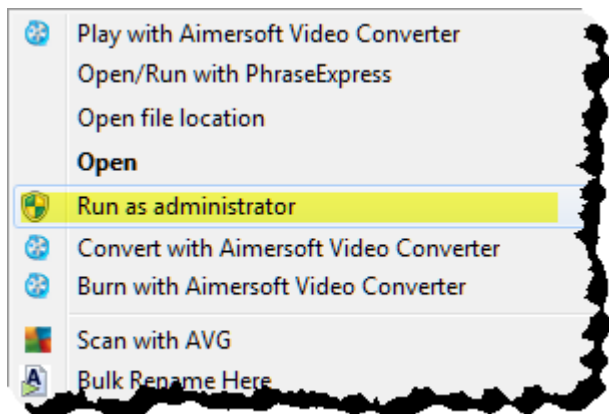

To install one or both of the files, extract them from the zip to the folder:

C:\Windows\SysWOW64

Next locate the Command Prompt from the Windows Start Menu > All Programs > Accessories.

Right click and select Run as Administrator (even if you are the administrator of the PC)

For Windows 8 See http://www.eightforums.com/tutorials/2754-elevated-command-prompt-open-windows-8-a.html
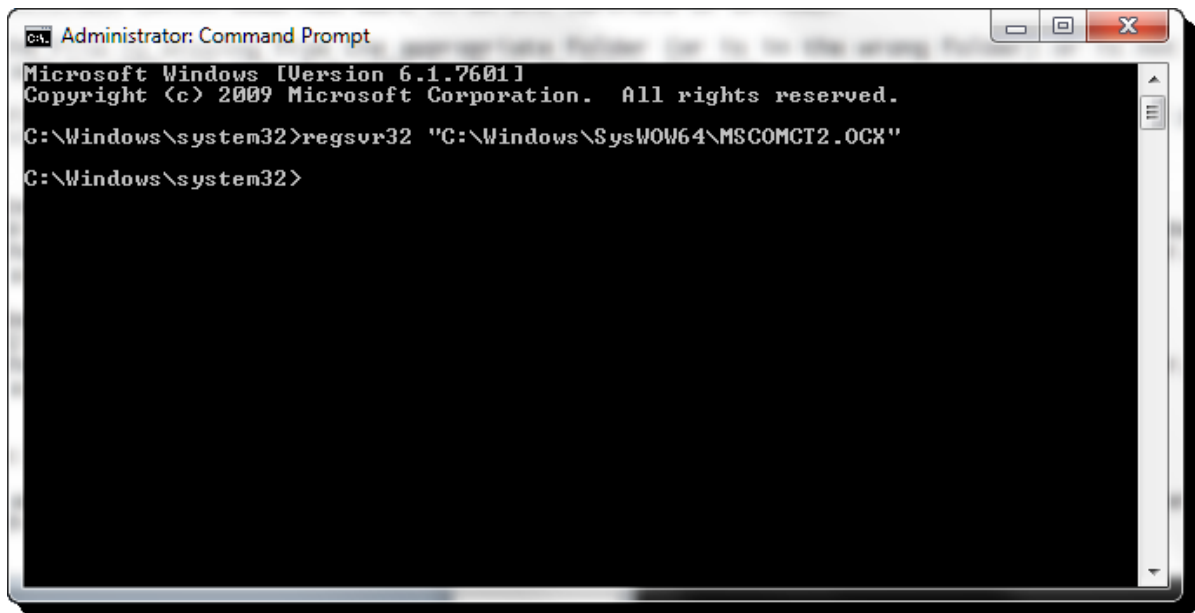

You should then see a window similar to that shown below.

The Window should open to the folder C:\Windows\system32 as shown in the next illustration.

**If the command line indicates any other folder** type:

CD\ C:\Windows\system32 at the flashing cursor and press the Enter key.

Next type **regsvr32 "C:\Windows\SysWOW64\mscomct2.ocx"** and press the enter key.

You should be rewarded with a message that the registration has been successful. An error message suggests that you have not followed the instructions correctly. 😟

For FM20.DLL, repeat the process substituting FM20.DLL for MSCOMCT2.OCX.
